

NOTICE OF AERIAL APPLICATION OF LARVICIDE TO CONTROL LARVAL MOSQUITOES

Parts of East Gwillimbury consist of low-lying terrain, which creates perfect breeding sites for the Spring Aedes Mosquito. Breeding habitats can be found in standing water areas such as woodlands, field pools and ditches that form after snow melts and spring rain occurs.

Weather permitting, between the end of March to the end of May 2026, the biological larvicide VectoBac 200G [PCP#18158, granular formulation] will be applied by helicopter to standing water mosquito breeding habitats within East Gwillimbury. This product contains the active ingredient *B.t.i*, which is very specific to mosquito larvae. Mortality results occur within 24 hours and the larvicide biodegrades within 72 hours.

A map showing the treatment areas is available online at eastgwillimbury.ca/mosquito. It is also available at Customer Service in the Civic Centre by request. If you **object** to having VectoBac applied to your property, you must complete the form below by **Friday, March 27, 2026** and submit it via fax, [email\[DM1\] \(ddodwell@eastgwillimbury.ca\)](mailto:ddodwell@eastgwillimbury.ca), or in person at the Civic Centre (in Customer Service or using the drop box located outside the building).

No response is required if you support the program.

MOSQUITO CONTROL PROGRAM OBJECTION FORM
